# Parallelization

MPI on a  
non-dedicated  
"cluster"

Markus  
Osterhoff

Outline

about me...

Simulation /  
Boundary  
Conditions

Solutions

Finish

- A full wave-optical treatment (parabolic wave equation) needs  $\approx 4$  months (for reasonable geometry)
- parallelization needed!
- But PWE only scales logarithmically (solving a tri-band matrix equation)

# Parallelization

MPI on a

## MPI: Message Passing Interface

- MPI is a language-independent communications protocol used to program parallel computers. Both point-to-point and collective communication are supported.

## MPI: Message Passing Interface

- MPI is a language-independent communications protocol used to program parallel computers. Both point-to-point and collective communication are supported.

MPI "is a message-passing application programmer interface, together with protocol and semantic specifications for how its features must behave in any implementation."

## MPI: Message Passing Interface

- MPI is a language-independent communications protocol used to program parallel computers. Both point-to-point and collective communication are supported.

MPI "is a message-passing application programmer interface, together with protocol and semantic specifications for how its features must behave in any implementation."

MPI's goals are high performance, scalability, and portability. MPI remains the dominant model used in high-performance computing today.
